

Filter press plants always consist of essential machines and components. Only an optimal tuning of the total system of the filtration plant guarantees for an economical and effective operation. The philosophy of Haecker is not to accept any compromise since the investment is requested to have an extended lifespan and to operate economically at the same time. Therefore the experience and the specific know-how of Haecker's experts make the difference. With the prerequisite of quality, functionality and lifespan Haecker produces as a competent system supplier different components as well as key-turn plants for solid/liquid filtration in a great variety of applications.

The engineering concept of a filtration plant reaches from chemical treatment of the slurry to the filtration by the filter press up to the handling of the filter cake. If required the filter cake could be treated i.e. by drying to reduce the final moisture content. The individual task of an application determines the processing. Is the filter cake destined for further use or is the result of the filtrate important? Are basically both, the filter cake and the filtrate important for further processing or are they waste? Numbers of significant details have to be analysed until an economical solution can be presented.

Filter presses plants
